

# Lighting Scan Conversion

Wolfgang Heidrich

Wolfgang Heidrich

## Course News

### Assignment 2

- Due Monday, Feb 28

### Homework 3

- Discussed in labs next wee

### Quiz 1

- Discussed in labs this week

### Reading

- Chapter 9, 3

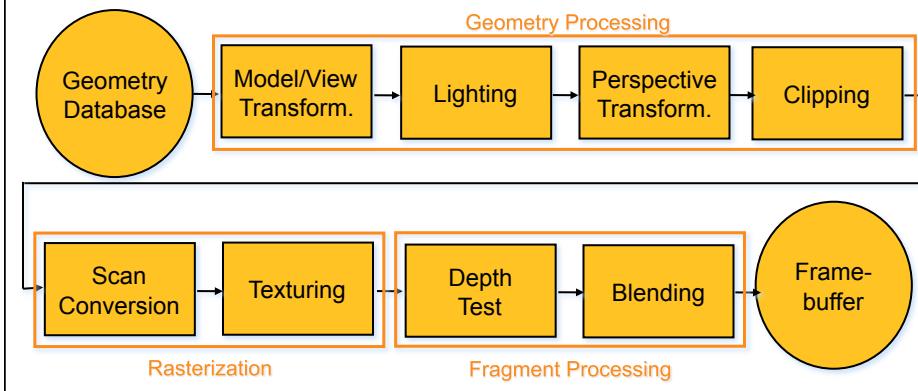

### Out of Town Friday

- Anika will fill in for me

Wolfgang Heidrich

## The Rendering Pipeline

Wolfgang Heidrich

## Lighting

### Goal

- Model the interaction of light with surfaces to render realistic images

### Contributing Factors

- Light sources
  - *Shape and color*
- Surface materials
  - *How surfaces reflect light*
- Transport of light
  - *How light moves in a scene (global illumination, later in the course)*

Wolfgang Heidrich

## Types of Reflection

- *Specular* (a.k.a. *mirror* or *regular*) reflection causes light to propagate without scattering.

- *Diffuse* reflection sends light in all directions with equal energy.

- *Mixed* reflection is a weighted combination of specular and diffuse.

Wolfgang Heidrich

## Types of Reflection

- *retro-reflection* occurs when incident energy reflects in directions close to the incident direction, for a wide range of incident directions.

- *gloss* is the property of a material surface that involves mixed reflection and is responsible for the mirror like appearance of rough surfaces.

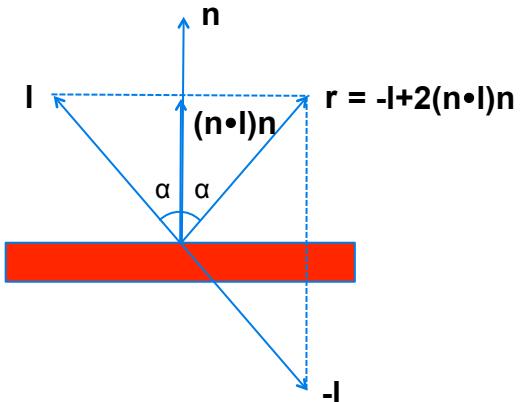

Wolfgang Heidrich

## Specular Reflection

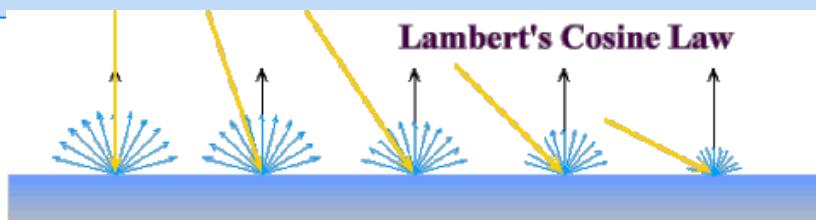

### Geometry of specular (mirror) reflection

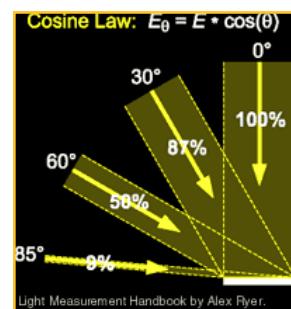

Wolfgang Heidrich

## Lambert's “Law”

### Lambert's Cosine Law

Intuitively: cross-sectional area of the “beam” intersecting an element of surface area is smaller for greater angles with the normal.

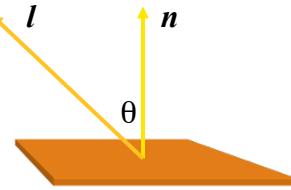

Light Measurement Handbook by Alex Ryer.

Wolfgang Heidrich

## Computing Diffuse Reflection

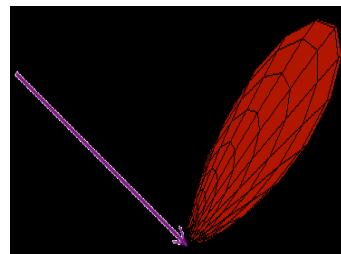

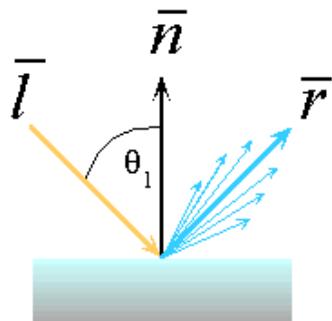

- Depends on **angle of incidence**: angle between surface normal and incoming light
  - $I_{\text{diffuse}} = k_d I_{\text{light}} \cos \theta$
- In practice use vector arithmetic
  - $I_{\text{diffuse}} = k_d I_{\text{light}} (\mathbf{n} \cdot \mathbf{l})$
- Always normalize vectors used in lighting
  - $\mathbf{n}, \mathbf{l}$  should be unit vectors
- Scalar (B/W intensity) or 3-tuple or 4-tuple (color)
  - $k_d$ : diffuse coefficient, surface color
  - $I_{\text{light}}$ : incoming light intensity
  - $I_{\text{diffuse}}$ : outgoing light intensity (for diffuse reflection)

Wolfgang Heidrich

## Glossy Materials – Empirical Approximation

### Angular falloff

how might we model this falloff?

Wolfgang Heidrich

## Phong Lighting

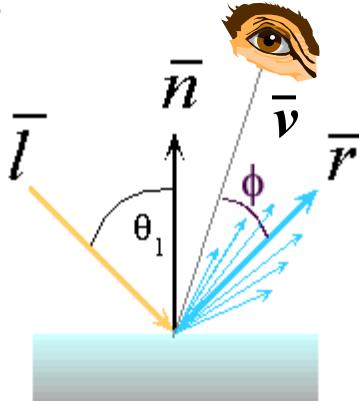

**Most common lighting model in computer graphics**

— (Phong Bui-Tuong, 1975)

$$I_{\text{specular}} = k_s I_{\text{light}} (\cos \phi)^{n_s}$$

$n_s$ : purely empirical constant, varies rate of falloff

$k_s$ : specular coefficient, highlight color  
no physical basis, works ok in practice

Wolfgang Heidrich

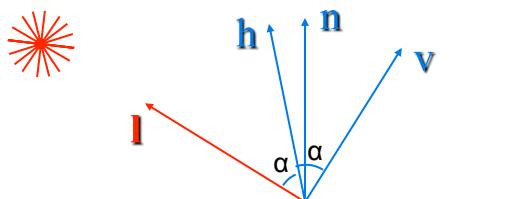

## Alternative Model

**Blinn-Phong model (Jim Blinn, 1977)**

- Variation with better physical interpretation
  - $\mathbf{h}$ : halfway vector;  $r$ : roughness

$$I_{\text{out}}(\mathbf{x}) = k_s \cdot (\mathbf{h} \cdot \mathbf{n})^{1/r} \cdot I_{\text{in}}(\mathbf{x}); \text{ with } \mathbf{h} = (\mathbf{l} + \mathbf{v}) / 2$$

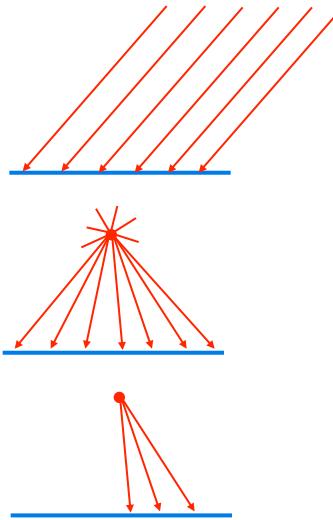

Wolfgang Heidrich

## Simple Light Sources

### Types of light sources

- Directional/parallel lights
  - *E.g.sun*
  - *Homogeneous vector*
- (Homogeneous) point lights
  - *Same intensity in all directions*
  - *Homogeneous point*
- Spot lights
  - *Limited set of directions*
  - *Point+direction+cutoff angle*

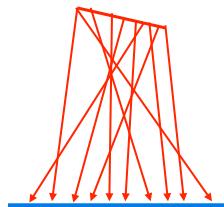

Wolfgang Heidrich

## Light Sources

### Area lights:

- Light sources with a finite area
- Can be considered a continuum of point lights
- Not available in many rendering systems

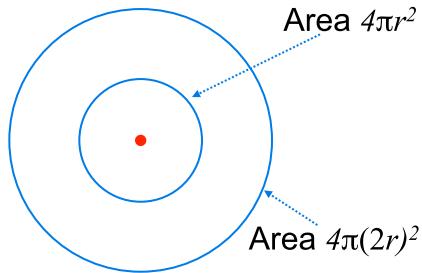

Wolfgang Heidrich

## Light Source Falloff

### Quadratic falloff (point- and spot lights)

- Brightness of objects depends on power per unit area that hits the object
- The power per unit area for a point or spot light decreases quadratically with distance

Wolfgang Heidrich

## Light Source Falloff

### Non-quadratic falloff

- Many systems allow for other falloffs
- Allows for faking effect of area light sources
- OpenGL / graphics hardware
  - $I_o$ : intensity of light source
  - $\mathbf{x}$ : object point
  - $r$ : distance of light from  $\mathbf{x}$

$$I_{in}(\mathbf{x}) = \frac{1}{ar^2 + br + c} \cdot I_0$$

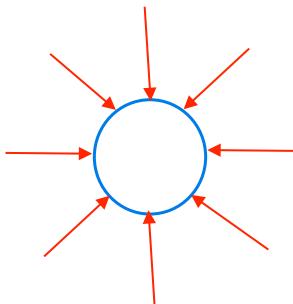

Wolfgang Heidrich

## Light Sources

### Ambient lights

- No identifiable source or direction
- Hack for replacing true global illumination
  - (*light bouncing off from other objects*)

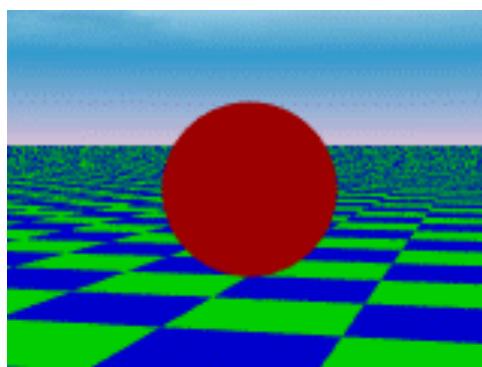

Wolfgang Heidrich

## Ambient Light Sources

- Scene lit only with an ambient light source

Light Position  
Not Important

Viewer Position  
Not Important

Surface Angle  
Not Important

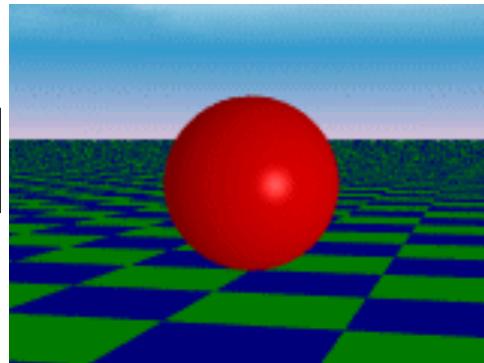

Wolfgang Heidrich

## Directional Light Sources

- Scene lit with directional and ambient light

Surface Angle  
Important

Light Position  
Not Important

Viewer Position  
Not Important

Wolfgang Heidrich

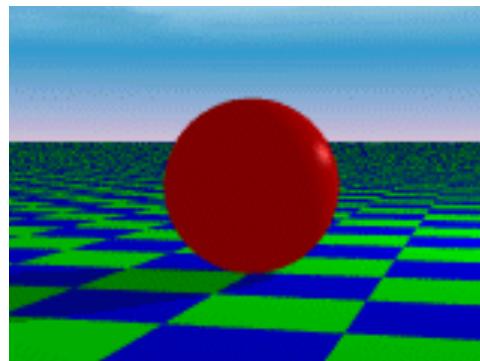

## Point Light Sources

- Scene lit with ambient and point light source

Light Position  
Important

Viewer Position  
Important

Surface Angle  
Important

Wolfgang Heidrich

## Light Sources & Transformations

### Geometry: positions and directions

- Standard: world coordinate system
  - Effect: lights fixed wrt world geometry
  - Demo: <http://www.xmission.com/~nate/tutors.html>
- Alternative: camera coordinate system
  - Effect: lights attached to camera (car headlights)
- Points and directions undergo normal model/view transformation

### Illumination calculations: camera coords

Wolfgang Heidrich

## Lighting Review

### Lighting models

- Ambient
  - Normals don't matter
- Lambert/diffuse
  - Angle between surface normal and light
- Phong/specular
  - Surface normal, light, and viewpoint

Wolfgang Heidrich

## Lighting in OpenGL

### ***Light source: amount of RGB light emitted***

- Value represents percentage of full intensity  
E.g., (1.0,0.5,0.5)
- Every light source emits ambient, diffuse, and specular light

### ***Materials: amount of RGB light reflected***

- Value represents percentage reflected  
e.g., (0.0,1.0,0.5)

### ***Interaction: multiply components***

- Red light (1,0,0) x green surface (0,1,0) = black (0,0,0)

Wolfgang Heidrich

## Lighting in OpenGL

```
glLightfv(GL_LIGHT0, GL_AMBIENT, amb_light_rgba );
glLightfv(GL_LIGHT0, GL_DIFFUSE, dif_light_rgba );
glLightfv(GL_LIGHT0, GL_SPECULAR, spec_light_rgba );
glLightfv(GL_LIGHT0, GL_POSITION, position);
 glEnable(GL_LIGHT0);
```

```
glMaterialfv( GL_FRONT, GL_AMBIENT, ambient_rgba );
glMaterialfv( GL_FRONT, GL_DIFFUSE, diffuse_rgba );
glMaterialfv( GL_FRONT, GL_SPECULAR, specular_rgba );
glMaterialfv( GL_FRONT, GL_SHININESS, n );
```

Wolfgang Heidrich

## Lighting in Rendering Pipeline

### Notes:

- Lighting is applied to every **vertex**
  - *i.e. the three vertices in a triangle*
  - *Per-vertex lighting*
- Will later see how the interior points of the triangle obtain their color
  - *This process is called **shading***
  - *Will discuss in the context of scan conversion*

Wolfgang Heidrich

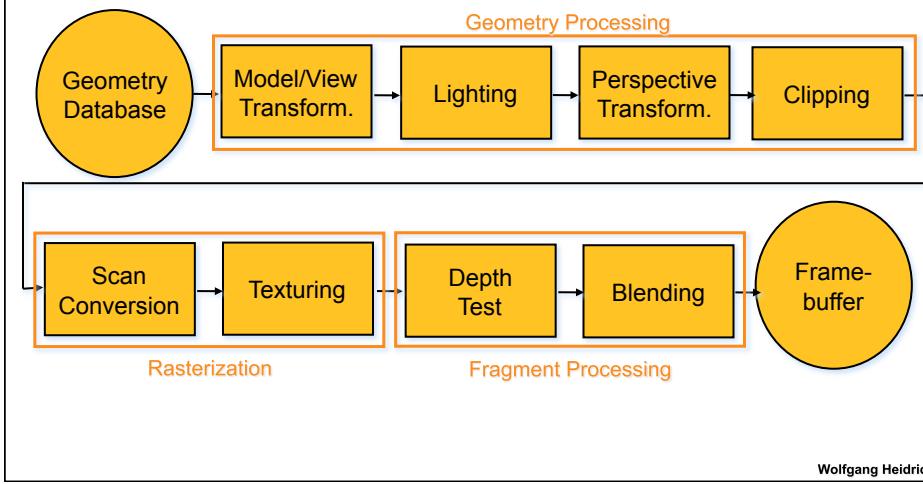

## Scan Conversion

Wolfgang Heidrich

Wolfgang Heidrich

## The Rendering Pipeline

Wolfgang Heidrich

## Scan Conversion - Rasterization

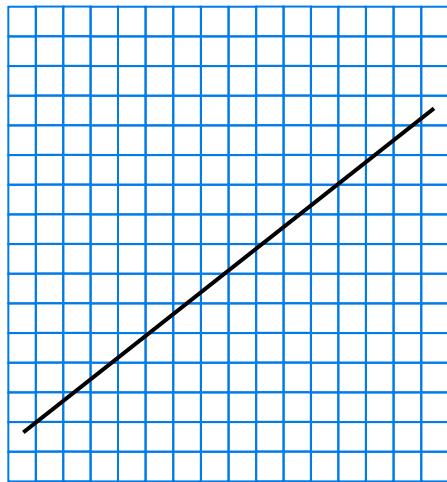

***Convert continuous rendering primitives into discrete fragments/pixels***

- Lines
  - *Midpoint/Bresenham*
- Triangles
  - *Flood fill*
  - *Scanline*
  - *Implicit formulation*
- Interpolation

Wolfgang Heidrich

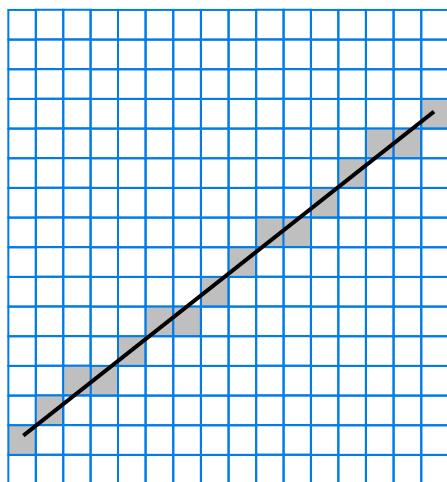

## Scan Conversion - Lines

Wolfgang Heidrich

## Scan Conversion - Lines

Wolfgang Heidrich

## Scan Conversion - Lines

### First Attempt:

- Line (s,e) given in device coordinates
- Create the thinnest line that connects start point and end point without gap

### Assumptions for now:

- Start point to the left of end point:  $xs < xe$
- Slope of the line between 0 and 1 (I.e. elevation between 0 and 45 degrees):

$$0 \leq \frac{ye - ys}{xe - xs} \leq 1$$

Wolfgang Heidrich

## Scan Conversion of Lines - Digital Differential Analyzer

### First Attempt:

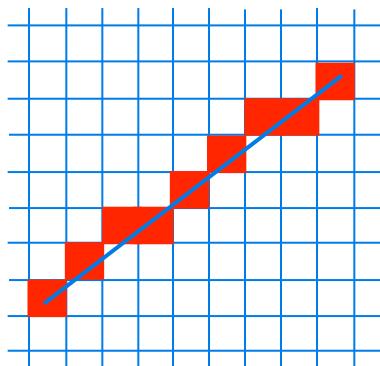

```
dda( float xs, ys, xe, ye ) {  
    // assume xs < xe, and slope m between 0 and 1  
    float m= (ye-ys)/(xe-xs);  
    float y= round( ys );  
    for( int x= round( xs ) ; x<= xe ; x++ ) {  
        drawPixel( x, round( y ) );  
        y= y+m;  
    }  
}
```

Wolfgang Heidrich

## Scan Conversion of Lines

DDA:

Wolfgang Heidrich

## Scan Conversion of Lines Midpoint Algorithm

Moving horizontally along x direction

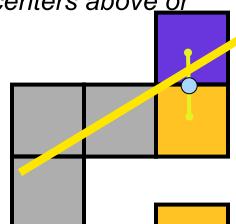

- Draw at current y value, or move up vertically to  $y+1$ ?

– Check if midpoint between two possible pixel centers above or below line

### Candidates

- Top pixel:  $(x+1, y+1)$
- Bottom pixel:  $(x+1, y)$

**Midpoint:  $(x+1, y+.5)$**

**Check if midpoint above or below line**

- Below: top pixel
- Above: bottom pixel

**Key idea behind Bresenham Alg.**

Wolfgang Heidrich

## Scan Conversion of Lines

### Idea: decision variable

```
dda( float xs, ys, xe, ye ) {  
    float d= 0.0;  
    float m= (ye-ys)/(xe-xs);  
    int y= round( ys );  
    for( int x= round( xs ) ; x<= xe ; x++ ) {  
        drawPixel( x, y );  
        d= d+m;  
        if( d>= 0.5 ) { d= d-1.0; y++; }  
    }  
}
```

Wolfgang Heidrich

## Scan Conversion of Lines Bresenham Algorithm ('63)

- Use decision variable to generate purely integer algorithm
- Explicit line equation:

$$y = \frac{(y_e - y_s)}{(x_e - x_s)}(x - x_s) + y_s$$

- Implicit version:

$$L(x, y) = \frac{(y_e - y_s)}{(x_e - x_s)}(x - x_s) - (y - y_s) = 0$$

- In particular for specific x, y, we have
  - $L(x, y) > 0$  if  $(x, y)$  below the line, and
  - $L(x, y) < 0$  if  $(x, y)$  above the line

Wolfgang Heidrich

# Scan Conversion of Lines

## Bresenham Algorithm

- Decision variable: after drawing point  $(x,y)$  decide whether to draw
  - $(x+1,y)$ : case E (for “east”)
  - $(x+1,y+1)$ : case NE (for “north-east”)
- Check whether  $(x+1,y+1/2)$  is above or below line

$$d = L(x + 1, y + \frac{1}{2})$$

- Point above line if and only if  $d < 0$

Wolfgang Heidrich

# Scan Conversion of Lines

## Bresenham Algorithm

- Problem: how to update  $d$ ?
- Case E (point above line,  $d \leq 0$ )
  - $x = x + 1;$
  - $d = L(x + 2, y + 1/2) = d + (y_e - y_s)/(x_e - x_s)$
- Case NE (point below line,  $d > 0$ )
  - $x = x + 1; y = y + 1;$
  - $d = L(x + 2, y + 3/2) = d + (y_e - y_s)/(x_e - x_s) - 1$
- Initialization:
  - $d = L(x_s + 1, y_s + 1/2) = (y_e - y_s)/(x_e - x_s) - 1/2$

Wolfgang Heidrich

## Scan Conversion of Lines

### Bresenham Algorithm

- This is still floating point
- But: only sign of  $d$  matters
- Thus: can multiply everything by  $2(x_e - x_s)$

Wolfgang Heidrich

## Scan Conversion of Lines

### Bresenham Algorithm

```
Bresenham( int xs, ys, xe, ye ) {  
    int y= ys;  
    incrE= 2(ye - ys);  
    incrNE= 2((ye - ys) - (xe-xs));  
    for( int x= xs ; x<= xe ; x++ ) {  
        drawPixel( x, y );  
        if( d<= 0 ) d+= incrE;  
        else { d+= incrNE; y++; }  
    }  
}
```

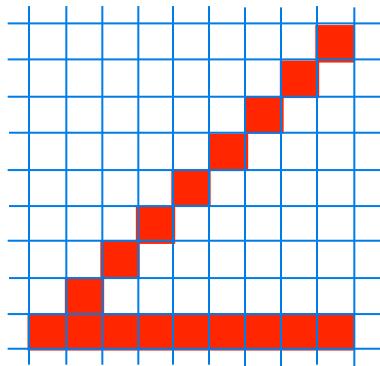

Wolfgang Heidrich

## Scan Conversion of Lines

### Discussion

- Bresenham sets same pixels as DDA
- Intensity of line varies with its angle!

Wolfgang Heidrich

## Scan Conversion of Lines

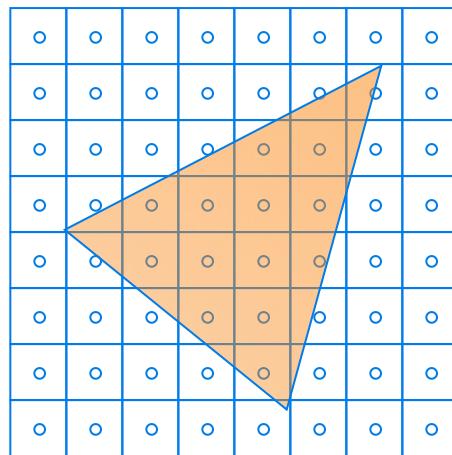

### Discussion

- Bresenham
  - Good for hardware implementations (integer!)
- DDA
  - May be faster for software (depends on system)!
  - Floating point ops higher parallelized (pipelined)
    - E.g. RISC CPUs from MIPS, SUN
  - No if statements in inner loop
    - More efficient use of processor pipelining

Wolfgang Heidrich

## Scan Conversion of Polygons

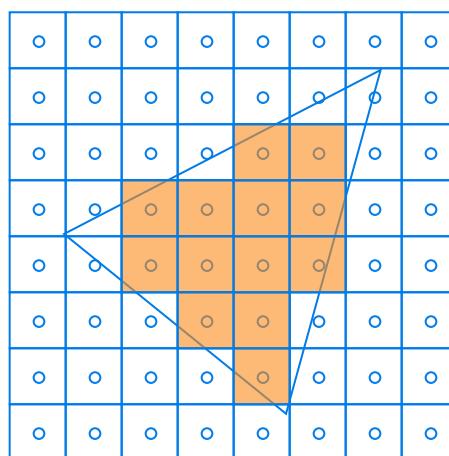

Wolfgang Heidrich

## Scan Conversion of Polygons

**One possible scan conversion**

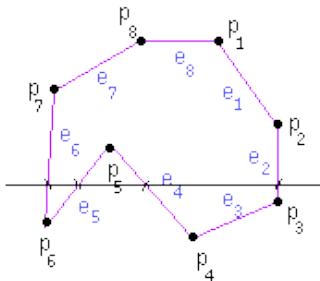

Wolfgang Heidrich

## Scan Conversion of Polygons

### A General Algorithm

- Intersect each scanline with all edges
- Sort intersections in x
- Calculate parity to determine in/out
- Fill the ‘in’ pixels

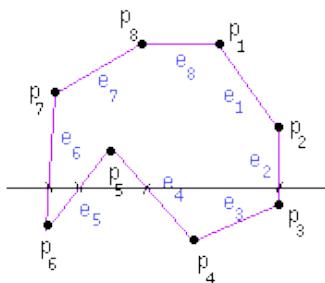

Wolfgang Heidrich

## Scan Conversion of Polygons

- Works for arbitrary polygons
- Efficiency improvement:
  - *Exploit row-to-row coherence using “edge table”*

Wolfgang Heidrich

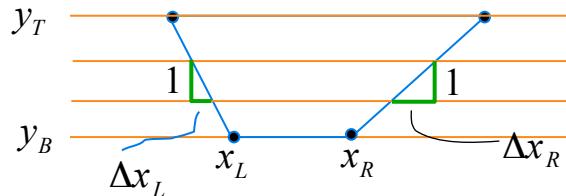

## Edge Walking

### Past graphics hardware

- Exploit continuous L and R edges on trapezoid

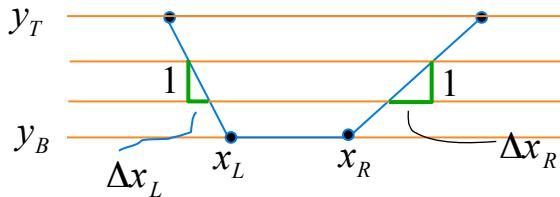

```
scanTrapezoid( $x_L, x_R, y_B, y_T, \Delta x_L, \Delta x_R$ )
```

Wolfgang Heidrich

## Edge Walking

```
for (y=yB; y<=yT; y++) {  
    for (x=xL; x<=xR; x++)  
        setPixel(x,y);  
    xL += DxL;  
    xR += DxR;  
}
```

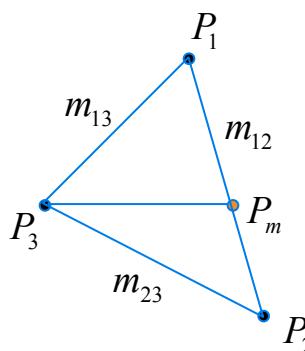

Wolfgang Heidrich

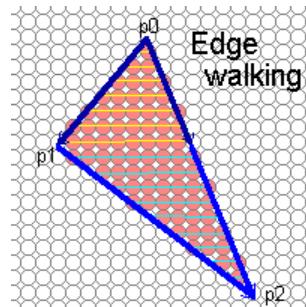

## Edge Walking Triangles

- Split triangles into two regions with continuous left and right edges

**scanTrapezoid(**  $x_3, x_m, y_3, y_1, \frac{1}{m_{13}}, \frac{1}{m_{12}}$  **)**  
**scanTrapezoid(**  $x_2, x_2, y_2, y_3, \frac{1}{m_{23}}, \frac{1}{m_{12}}$  **)**

Wolfgang Heidrich

## Edge Walking Triangles

### Issues

- Many applications have small triangles
  - Setup cost is non-trivial
- Clipping triangles produces non-triangles
  - This can be avoided through re-triangulation, as discussed

Wolfgang Heidrich

## Coming Up:

### *Friday*

- More scan conversion
- Lecture by Anika

Wolfgang Heidrich
